SUMMARY

Software engineer with 5+ years building enterprise ERP, CRM, and eCommerce platforms end to end. Specializes in backend architecture: REST API design, relational and document data modeling, query and caching optimization, and containerized deployment on AWS. Cut database query time by 80% on a production ERP, designed role-based access control for multi-tenant systems, and mentored junior engineers through code review and architecture standards. Works across Node.js, Laravel, React, and Next.js.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, PHP, Python, SQL

Backend: Node.js, Express, Laravel, REST APIs, GraphQL, WebSockets, authentication & RBAC, background jobs & queues

Frontend: React.js, Next.js, Redux, Vue.js, Tailwind CSS, HTML5, CSS3

Databases: MySQL, MongoDB, Redis — schema design, indexing, query optimization, caching

Cloud & DevOps: AWS (EC2, S3, CloudFront), Docker, CI/CD pipelines, Git, Linux, Nginx

Practices: System design, code review, unit & integration testing, performance profiling, Agile/Scrum

PROFESSIONAL EXPERIENCE

Software Engineer — 3Amigos

Lahore, Pakistan | 05/2024 – Present

- Architected the backend for a multi-tenant ERP and CRM platform on Node.js and Laravel, owning the data model, service boundaries, and public API surface.
- Cut database query time by 80% by eliminating N+1 access patterns, adding composite indexes on high-cardinality lookup columns, and introducing a Redis caching layer for hot reads.
- Designed and shipped versioned REST APIs for order, inventory, and billing workflows, backed by contract tests so downstream clients could upgrade without breaking changes.
- Automated recurring business processes by integrating third-party payment, notification, and accounting services, replacing manual back-office data entry.
- Containerized services with Docker and automated deployment to AWS EC2, standardizing releases across staging and production environments.

Software Engineer — Optima Geeks

Lahore, Pakistan | 05/2023 – 04/2024

- Built full-stack features across MERN, Laravel, and Python services, from schema design through production React interfaces.
- Improved data retrieval performance on MySQL and MongoDB workloads through indexing strategy, query rewrites, and aggregation pipeline tuning.
- Integrated third-party APIs with retry, idempotency, and structured error handling, making external calls resilient to partial failure and timeouts.
- Standardized Docker-based development environments and a Git branching workflow, shortening onboarding time for new engineers.
- Delivered responsive React.js interfaces in close collaboration with design and product stakeholders.

Backend Engineer (Laravel) — Virtual Underdogs

Lahore, Pakistan | 01/2022 – 04/2023

- Led backend architecture for a CRM platform, owning the data model, API surface, and deployment path end to end.
- Designed secure REST APIs with token-based authentication and role-based access control across multiple permission tiers.
- Normalized relational schemas and tuned indexes in MySQL, improving response times on the highest-traffic endpoints.

- Mentored junior engineers and established code review standards that reduced recurring production defects.
- Partnered with React.js frontend teams to define API contracts up front, eliminating integration rework late in the cycle.

Associate Software Engineer — Flitkick Innovations FZE

Lahore, Pakistan | 10/2020 – 12/2021

- Owned end-to-end delivery of an enterprise ERP module in Laravel and React.js, coordinating backend and frontend integration across the team.
- Designed MySQL schemas and optimized queries for high-volume transactional data, keeping reads fast as record counts grew.
- Reduced page render time by introducing application-level caching and eliminating redundant API calls.
- Built interactive frontend components in JavaScript and React.js, and used Docker and Git in a collaborative delivery workflow.

SELECTED PROJECTS

OnwardOps — Enterprise Service Platform | Laravel, Node.js, MySQL, AWS

- Built the backend from scratch: REST API layer with authentication and role-based access control, MySQL schema design, and an automated workflow engine for recurring service operations.
- Reduced query latency through index redesign and denormalization of hot read paths.

Jahavl.com — B2B eCommerce Management System | Laravel, React.js, MySQL

- Architected multi-role order management covering buyer, seller, and admin workflows, on a relational schema built for transactional and inventory data.
- Implemented secure third-party API integrations and optimized checkout backend throughput.

Redefine.church — Live Streaming & Media Platform | Node.js, WebSockets, Docker, AWS

- Built real-time chat over WebSockets for live stream audiences, handling connection lifecycle and message fan-out.
- Designed media recording and content management services, and optimized server performance and deployment using Docker and AWS.

EDUCATION

Bachelor of Science in Computer Science | Bahria University | 2018 – 2022

Coursework: Data Structures & Algorithms, Operating Systems, Database Systems, Computer Networks, Software Engineering, Object-Oriented Design.
